Re: Disposal of water

Dear Sir:

I would like to take this opportunity to ask for your approval to dispose of the water collected from the incident at the DrillChem Facility located in Conroe, TX. At this time we have approximately 79,000 gallons of water that has been treated for BTX and TPH that is collected into 5 Frac tanks.

The water has been treated with AMS 101 and MicroBoost. These products have effectively reduced the TPH and BTEX levels. Field Test completed using the Handy Environmental water field test kit shows the levels have been reduced to less than 5 mg/L. See picture of field test results below.

Our original intent was to use this water to irrigate the containment pond to enhance the Bio-remediation of the soil. However, with the recent rains and future forecasted rains coming we feel that it would better to dispose of the water. I have contacted Key Energy Services and they can dispose of the water at their facility the Lisa #1d located at 7190 Raymond Stotzer Blvd College Station, TX 77845. With your approval we would like to start removing the water from this location as soon as possible. Thank you in advance for your quick response.

Best Regards

Davis Evans
